Price List of . . .

SERVICES AND —MISCELLANEOUS SUPPLIES

JACK ROE (CINEMA SUPPLIES) LIMITED

40 BUXTON ROAD LUTON BEDS.

'phone Luton 30922

Gentlemen,

In response to many requests, we have produced this price list to give a general idea of the supplies and services that we have to offer. Foremost, our aim is to promote good, safe economy coupled with speedy service and delivery. We still believe in the rather old fashioned idea that the customer is always right, for without you we cannot exist. We are certain that we can save you money through our Arc Mirror and Spool services, plus "Endless" Carbons, "Econoclips" and competitive prices of other supplies. We have excellent facilities for making special items that you may have difficulty in obtaining or, indeed, think that we may be able to improve on the price aspect. Why not give us the opportunity of serving you? It is the only way that we can prove ourselves.

Yours faithfully,

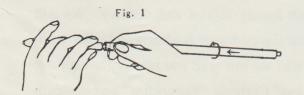

for JACK ROE (CINEMA SUPPLIES) LTD.

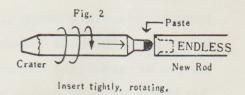

RONALD C. ROE,

Managing Director.

HOW TO USE "ENDLESS" CARBONS

- 1. It is recommended that the positive stub to be connected be no less than $2\frac{3}{4}$ " in length. Connect the stub to a new positive carbon rod when cooled, referring to fig. 1 and 2 below.
- 2. The quantity of carbon paste to be used at one time should be just bigger than an ordinary match head. After connection, if the paste overflows from the junction, wipe it off.
- 3. After striking the arc, the connection will be perfect within two or three minutes by the heat generated.
- 4. If the convex of the stub is just too big to nsert into end of new rod, rub the convex with sandpaper supplied with carbons.
- 5. No air should be left in the concave of the carbon after connection.

N.B.—It should be noted that only the positive carbons lend themselves to this unique joining process; the "Endless" brand negative carbons, of course, have the slow burning advantage. It will, therefore, almost certainly be necessary to slow down the carbon feed motor by rheostat adjustment, to retain the correct arc gap.

As it is difficult for us to assess the demand in the initial stages of introduction, it is advisable, once you have decided to use "Endless" carbons, to re-order supplies three months in advance. This will enable us to maintain a steady supply in view of the distance from the manufacturer.

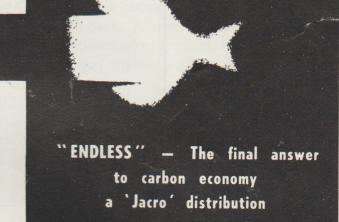

It is regretted that it will not be practical to supply free samples owing to the need for the special carbon joining paste, which is supplied in tubes for boxes of 50 pieces. We also have to point out that owing to the high import tariff, these carbons can only be obtained DIRECT from us, the sole distributors.

HERE AT LAST!

Revolutionary Cinema Carbons

'ENDLESS'

Incorporating a method of joining positive carbons together, which we recently perfected, "ENDLESS" D.C. and A.C. carbons produce an extremely bright and stabilised arc which is comparable to any other leading brand. Made in Japan in an up-to-date factory of 30 years' carbon manufacturing experience, every rod is rigidly tested at each stage of production to ensure uniform quality. They are copper covered and nickel finished. They cost no more than ordinary conventional carbons, but have the following MONEY SAVING ADVANTAGES:

- * A positive stub of "Endless" can be easily connected to a new "Endless" positive rod with the aid of the special paste supplied with the carbons.
- ** The burning rate of "Endless" is very low and you save the cost of carbon further.
- *** The need to buy carbon savers is eliminated. Burn your positive carbons right up every time.

On	erating Data	Average Burning Rate			
Ор	erating Data	(Inch per hour)			
Positive	Negative	Amperes	Arc Volts	Positive	Negative
7 mm x 12"	6 mm x 9"	40 — 50	32 - 35	7.5	3.5
8 mm x 12"	7 mm x 9"	60 — 70	34 — 35	8.4	3.0
9 mm x 12"	8 mm x 9"	75 — 85	40 — 45	10.5	3.3

EACH CARTON CONTAINS 50 PCS.

ARC MIRROR RENOVATING

(d)

We can put a new lease of life on your Arc Mirrors provided they are not cracked or *severely* carbon pitted. Work consists of repolishing the front surface to remove all smoke haze and stains, but *not* carbon pit marks, and heat resisting silvering the back. A small amount of carbon pit marks are not detrimental to the light, for if all pit marks could be gathered together they would all go into a circle less than one inch in diameter, and this small loss would not be noticeable. Mirrors should be sent to us well packed in a wooden container brim full with packing. Work only accepted at owner's risk. Mirrors returned in approximately 28 days.

Our Unique Circuit Mirror Plan

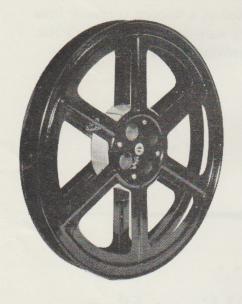

It is easy to see that by entrusting your circuit mirror supplies to us, we can combine the sale of new mirrors with our mirror renovating service, netting you a huge saving over a given period. Our idea, already in operation, works as follows:—

- 1. Supply new mirrors to your cinemas as required.
- 2. Instructions are given to return to us used mirrors in our returnable packing case.
- 3. These will be inspected for recovery of suitable ones to be processed as above. (Some losses will be inevitable through being damaged or too badly pitted.)
- 4. Having been renovated, advice will be sent to you stating type and quantity available in your pool for disposal.
- 5. We will hold them in stock and charge only when you allocate them to your cinemas by official order.

N.B.—Meter tests have shown that a good renovated mirror equals the performance of a new one.

SPOOL RECONDITIONING

Your Spools can be effectively reconditioned at less than half the cost of new ones. Process consists of hard brass bushing the Spool hub, repressing, straightening, re-aligning and re-spraying the Spool flanges and assembling with new screws. This service, a boon to circuits and already being used by most in the country, is designed to save you money. Most projectionists prefer these to new ones as they receive a really true spool. Spools returned in approximately 28 days, all work being carried out in our workshops.

Charge per Spool 2,000', Ref. 116; 3,000', 116/A

(G.B.-Kalee Rivet Flange Type, 1/- extra)

Packed free. Carriage extra (film transport)

CARBON 'ECONOCLIPS'

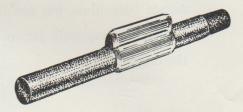

(b)

For the "Endless" Negative and when using ordinary conventional carbons.

Here is a "must" for the Projection Room, the very latest economic idea for using up all those irritating short ends of carbon that seem to accumulate. Simply couple a reasonably short end together with a new carbon and use like a normal Saver, burning to the last $\frac{1}{2}$ " or so. You can use over again.

"Econoclips" will not, and are not intended to, burn through to the new carbon. Advantages are low cost, simple speedy clip action, longer time factor for burning up short ends and if you do miscalculate on length the clip will burn away and only $2\frac{1}{2}d$. is lost without stopping the show.

May & Baker Product

FILM CEMENTS Etc.

'TRICOID' is a film splicing solution specially designed for use with triacetate film base; it is also very satisfactory for normal acetate base, but should not be used for nitrate base. The resulting joints have a very great strength and are free from blush.

500 cc Size, Ref. 119 Packed free

'EMBACOID' Film Cement is designed for splicing acetate and nitrate base films, but not the newer triacetate base. Laboratory tests have frequently proved that joints are usually stronger than the original film.
